Mt. Gox

The screenshot shows the Mt. Gox website interface. At the top, a browser address bar displays "https://mtgox.com" with a security warning for "K.K. Tibanne [JP]". A dark grey header bar contains market data: "Last price:\$93.30000", "High:\$93.80000", "Low:\$91.00000", "Volume:20525 BTC", and "Weighted Avg:\$92.72940". The main content area features the Mt. Gox logo, a login form with "Username" and "Password" fields, and a "Sign up" button. A central graphic shows a computer monitor with a Bitcoin symbol on the screen, surrounded by a circular pattern of coins. A green "SIGN UP NOW" button is positioned on the left. At the bottom, a quote from Wikipedia states: "As of July 2011, Mt. Gox handles over 80% of all Bitcoin trade". A blue box on the right contains the text "Payments made easy."

Mt. Gox Data Dump

- In early 2014, dump of 18 million matching buy and sell transactions on Mt. Gox between April 2011 and November 2013 was leaked
- Transaction fields
 - Unique trade identifier
 - Timestamp
 - Amount traded
 - Currency
 - Exchange rate
 - Internal numeric user identifier
- Deduplicated to 14 million trades by selecting unique (user ID, timestamp, transaction type, amount traded) per transaction

Mt. Gox Data Dump

- Q: But isn't the blockchain public?
- A: Yes, but most trades never are recorded on the blockchain
- The Gox dump sheds light on internal trades on the biggest Bitcoin currency exchange
- It also links trades made by the same user

The Willy Report: proof of massive fraudulent trading activity at Mt. Gox, and how it has affected the price of Bitcoin

Posted on [May 25, 2014](#)

This gallery contains [21 photos](#).

Somewhere in December 2013, a number of traders including myself began noticing suspicious bot behavior on Mt. Gox.

Basically, a random number between 10 and 20 bitcoin would be bought every 5-10 minutes, non-stop, for at least a month on ... [Continue reading →](#)

Suspicious Trader 1: Markus

- Began buying bitcoin 2013-02-14 and became inactive 2013-09-27
- Acquired 335,898 bitcoin worth around 76 million USD on 33 days
- Only fraudulent account to buy and sell bitcoin, but mostly bought
- Never paid transaction fees
- Paid seemingly random values for bitcoin
- Records within the leaked data show altered transactions
 - Price was modified to values more consistent with exchange rate

Suspicious Trader 1: Markus

1362466154714939	2013-03-05 06:49	634	buy	1	38.11000	3564.883

Suspicious Trader 2: Willy

- Collection of 49 accounts with identical trading activity
- Began buying bitcoin 2013-09-27 and was active through 2013-11-30
- Traded on 50 of the 91 days in period 4
- Bought around 268,132 bitcoin for 112 million USD
 - Each rapidly bought 2.5 million USD
 - Never sold
- Abnormally high user IDs for time period
 - IDs for this time period capped around 650000
 - Willy account IDs ranged from 658152 - 832432

Suspicious Trader 2: Willy

- Unlike for Markus, Willy did not create altered duplicate transactions
- Instead, he “bought” BTC at market rates from real users by crediting their fiat currency balance
 - Willy did not actually deposit fiat currency in his account
- In effect, this created an artificial BTC surplus at Mt. Gox and a fiat deficit
- Customers who tried to withdraw fiat were slowed by currency controls imposed by Mt. Gox

What Motivated Willy's Behavior

Theory 1: Pump and Dump

- Bad coding practices led to the ability to initiate costless bitcoin purchases
- After driving up the price of bitcoin, balances sold off at a profit

Theory 2: Incompetence turned Ponzi scheme

- Hackers stole massive amount of bitcoin in June 2011 and Mt. Gox founder, Mark Karpales, took extraordinary steps to cover up loss.
 - Allegedly 1,000,000 BTC lost
 - Accounts bought BTC attempting to turn the BTC deficit into a fiat deficit
 - Thought to use trading fees instead of customer funds

Regression Analysis

$$\text{RateChange}_t = \beta_0 + \beta_1 \text{Markus}_t + \beta_2 \text{Willy}_t + \beta_3 \text{DDoS}_t + \beta_4 \text{DayAfterDDoS}_t + \beta_5 \text{Other}_t + \epsilon_t$$

- *Dependent variable*: daily USD/BTC price change
- *Independent variables*
 - **Markus**: dummy variable (1 on days where Markus is active)
 - **Willy**: dummy variable (1 on days where Willy is active)
 - **DDoS**: dummy variable (1 on days with reported DDoS)
 - **Day after DDoS**: dummy variable (1 on days after reported DDoS)
 - **Other**: dummy variable (1 on days after reported non DDoS event)

Results

Table: Examining Price Changes Within Mt. Gox and the other platforms

Independent Variables	Dependent Variable	Mt.Gox Rate Change	Bitstamp Rate Change	Bitfinex Rate Change	BTC-E Rate Change
Markus		2.79 (0.72)	3.24 (0.96)	2.06 (0.31)	2.37 (0.71)
Willy		21.65*** (6.66)	20.21*** (7.18)	19.23*** (3.63)	19.04*** (6.81)
DDoS		-2.38 (-0.55)	-1.67 (-0.44)	-1.87 (-0.26)	-2.01 (-0.54)
Day After DDoS		-3.50 (-0.80)	-3.25 (-0.86)	-2.9 (-0.41)	-2.68 (-0.72)
Other Attacks		7.16 (0.82)	5.70 (0.75)	7.35 (0.44)	5.61 (0.75)
<i>N</i>		365	365	244	0.108
adj. <i>R</i> ²		0.104	0.120	0.037	0.108

t statistics in parentheses

p* < 0.05, *p* < 0.01, ****p* < 0.001

Conclusion (1)

- Manipulations can have important, real effects
 - Unauthorized trades by a single actor caused a massive spike in USD-BTC exchange rate (from \$150 to \$1000 in two months)
 - DDoS attacks, other shocks did not affect price, but fraudulent trades did
 - Within 3 months of the fraud, Mt. Gox collapsed and the USD-BTC price fell by half

Conclusion (2) – Why is this important?

Conclusion (3)

- Why is this important?
 - Massive cryptocurrency market cap growth (over 1,900%)
 - Cryptocurrencies remain susceptible to fraud
 - Currency exchanges still subject to little regulatory oversight
- What should be done to prevent fraud now?
 - Exchange operators should share anonymized trade data with regulators and outside researchers
 - Operational security practices should also be audited
 - Suspicious activity, if detected early, could forestall a fraud-stoked bubble
